Case Study: Playlist Manager in Spotify Clone

Title:

Case Study on Playlist Manager in Spotify Clone

Overview:

This case study focuses on the development of a Playlist Manager feature in a Spotify Clone inspired by Spotify. The system allows users to create playlists, add songs, and play them efficiently, improving music organization and accessibility.

Introduction:

Music streaming platforms like Spotify provide playlist features to organize songs based on user preferences. This project implements a simplified version of playlist management where users can group songs and play them easily. It helps in understanding how modern music applications handle user interaction and organization.

Problem Statement:

Users face difficulty in organizing songs into meaningful groups, accessing their favourite songs quickly, managing music collections efficiently. Without playlist functionality, users must search songs repeatedly, which reduces usability and efficiency. Existing tools may be insufficient for managing playlist based on multiple criteria, causing wasted time and frustration.

Methodology:

Requirement Analysis: Studied playlist functionality of Spotify. Identified core features like playlist creation and adding songs.

Design: Designed a simple playlist creation and song display system for playlist.

Implementation: Developed the program for managing playlist and playback using sample song data.

Testing: Tested playlist creation and verified song addition to playlists.

Proposed Solution:

The “Playlist Manager” system offers:

- Creation of playlists
- Adding songs to playlists
- Search functionality to locate specific songs by name.
- Smooth playback of songs.
- Simple and user-friendly interface

Discussion:

Improves organization of songs

Makes accessing music faster and easier

Enhances user experience with structured playlists

Limitations include no option to remove songs from playlist, uses static/local data, limited scalability

Future improvements could include add remove/edit playlist functionality, cloud storage integration, advanced playlist features (sorting, sharing)

Presentation:

Include:

- Screenshots of program interface or GitHub repository.
- Sample playlists and songs
- Workflow: Create Playlist → Add Songs → Play

Conclusion:

The Playlist Manager in Spotify Clone successfully demonstrates how songs can be organized and played efficiently using playlists. Although it lacks song removal functionality, it provides a strong foundation for understanding music management systems. Future improvements can make it more dynamic and feature-rich.
